VENTEC ELECTRONIC (Suzhou) Co., Ltd Microtek

Microtek CLIENT: **REFERENCE:** ASTM E 595

> **TEST ITEM:** Outgassing

SAMPLE: VT-870

REPORT No.: 23643E

TEST RESULTS:

The samples were tested by the indicated test methods within this report. Actual detailed test Microtek results are enclosed.

Outgassing

<u>TEST SPECIMEN</u>

VT-870 1 piece

REFERENCE

ASTM method E 595 (15) Total Mass Loss and Collected Volatile Condensable Materials from Outgassing in Vacuum Environment

<u>METHOD/ REQUIREMENT</u>

Weigh a prepared aluminum foil boat and return it to the glass storage desiccators. Weigh a prepared collector plate and mount it into its cooling plate receptacle. Add the test specimen to the boat and condition the specimen at 23°C, 50%RH for a minimum of 24h. Weigh the conditioned specimen and boat. Place the test specimen and boat into the specimen compartment in the temperature-vacuum system. Mount the respective cover plates of each specimen compartment and at least 3 control compartments. Close and activate the vacuum system and allow the system to evacuate to 7.0×10^{-3} Pa or less within 1h. During this period, control of the collector plate temperature at $25^{\circ}C \pm 1^{\circ}C$ shall be achieved. When the required vacuum has been achieved, turn on the heater and adjust the controller to heat the bar to 125°C $\pm 1^{\circ}$ within 60 min. Maintain the collector plate temperature at 25° $\oplus \pm 1^{\circ}$ C and the heater bar temperature at $125^{\circ} \text{C} \pm 1^{\circ} \text{C}$ for 24h. After this period close the vacuum valve to pumping system and turn off the current to the heater bars. Open the went valve and backfill with clean, dry nitrogen at a gage pressure of (10 - 30) kPa above atmosphere to rapidly cool the bars to 50°C within 2h. Turn off the collector-plate heat exchangers, return the vacuum chamber to room pressure. Remove the aluminum specimen boats and their respective collector plates and the control collector plates and immediately store in the desiccators. After allowing the specimens to cool to room temperature, weigh the specimens and boats and the collector plates within 2 min of removal from the desiccators.

Calculation of Total Mass Loss(TML) as follows:

Mass Loss (L)= S_I - S_F Total Mass Loss (TML)(%)=(L/ S_I)×100 Where: S_I = Initial specimen mass SF = Final specimen mass

L= Mass Loss.

Calculate the Collected Condensable Volatile Material (CVCM) as follows: Mass of condensable material(C_0) = C_F - C_I CVCM(%)=(C_0/S_I)×100 Where: C_F = Final Mass of collector plate C_I = Initial mass of collector plate

Aicrotek

MCQD530-02(2019)

(Page 3 of 5)

 C_0 = Mass of condensable material $S_I = Initial specimen mass$

RESULTS

The sample was tested by the methods given above. See attached test data sheet for actual test result.

CERTIFICATE OF CONFORMANCE

Microtek (Changzhou) Laboratories certifies that the test equipment used complies with the calibration requirements of correlation criterion and that the data contained in this report is accurate within the tolerance limitation of this equipment.

The report is invalid without signature of approver and "Special seal for test report", and the test results of this report are only responsible for tested samples.

The report shall not be reproduced, except in full, without the written approval of Microtek (Changzhou) Laboratories.

Thank you for selecting Microtek (Changzhou) Laboratories for your testing requirements.
